February 1995

Studs
with a length of engagement equal to about 2 d

DIN 835

ICS 21.060.10

Supersedes December 1972 edition.

Descriptors: Fasteners, studs

Stiftschrauben, Einschraubende ≈ 2 d

In keeping with current practice in standards published by the International Organization for Standardization (ISO), a comma has been used throughout as the decimal marker.

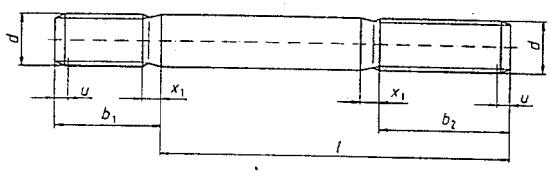
The studs specified in DIN 949-1 shall be given preference over those specified in the present standard, as the latter is to be withdrawn by 31 January 2000 (see Explanatory notes).

Dimensions in mm

1 Scope and field of application

This standard specifies dimensions and technical delivery conditions for studs intended for use mainly in aluminium alloys. As specified in DIN 267-2, the stud end thread shall be produced to tolerance 5k6 as in DIN 13-51, unless the stud is designated Fo ('without interference-fit thread') or Sn4.

2 Dimensions



DIN 78 — K type nut end

u (incomplete thread): 1,5 P maximum.

b_1 = stud end
b_2 = nut end

Continued on pages 2 to 4.

200											556	686	820

[1]) For lengths, l, of 125 mm or less.

[2]) For lengths, l, above 125 mm up to 200 mm.

[3]) For lengths, l, exceeding 200 mm.

Lengths above 200 mm shall be graded in 20 mm steps.

Bracketed sizes and intermediate lengths should be avoided if possible.

The zone between the continuous thick lines indicates the range of commercial sizes of studs with coarse pitch thread.

Studs of sizes above this range cannot be manufactured with a nut end thread length, b_2, as specified in the table. In such cases, b_2 will be approximately equal to $l - (x_1 + 3)$. For sizes above the dashed line, $b_2 + x_1$ will be less than 1,2 b_1. The nut end of these studs shall be rounded (i.e. given a DIN 78—L type end), unless the end is already marked with the property class.

3 Technical delivery conditions

Table 2: Technical delivery conditions

Material		Steel	
General requirements		As specified in ISO 8992.	
Thread	Tolerance	Stud end: 6k	Nut end: 6g
	As specified in	DIN 13-51.	DIN 13-12 and DIN 13-15.
Mechanical properties	Property class [1]) (material)	5.6, 8.8 or 10.9	
	As specified in	DIN EN 20 898-1.	
Limit deviations, geometrical tolerances	Product grade	A	
	As specified in	ISO 4759-1.	
Surface finish		Property class 5.6: as processed. Property classes 8.8 and 10.9: (thermally or chemically) blackened. DIN 267-2 shall apply with regard to surface roughness. DIN EN 26 157-3 shall apply with regard to limits for surface discontinuities. ISO 4042 shall apply with regard to electroplating. The limits of thread size shall also apply after coating.	
Acceptance inspection		As specified in ISO 3269.	

[1]) Use of other property classes or materials shall be subject to agreement.

4 Designation

Designation of a stud with an M12 interference-fit thread as in DIN 13-51, with a nominal length, *l*, of 80 mm, and assigned to property class 8.8:

Stud DIN 835 — M12 × 80 — 8.8

Designation of an M12 stud without interference-fit thread (Fo), with a nominal length, *l*, of 80 mm, and assigned to property class 8.8:

Stud DIN 835 — M12 Fo × 80 — 8.8

Where studs are to be supplied with a different thread on either end, this shall be indicated in the designation, with the symbol for the thread of the stud end preceding that for the nut end, e.g.:

Stud DIN 835 — M12 — M12 × 1,25 × 80 — 8.8

DIN 962 shall apply to the designation of type and finish, with additional information to be given on ordering.
The DIN 4000 — 2 — 4 tabular layout of article characteristics shall apply to studs as covered in this standard.

Amendments

The following amendments have been made to the December 1972 edition.

a) By analogy with ISO 4759-1, the length of the stud end is now designated b_1.
b) Symbol b has been replaced by b_2.
c) By analogy with DIN 78, symbol z_1 has been replaced by u.
d) By analogy with DIN 76-1, symbol x has been replaced by x_1.
e) The standard has been editorially revised.

Explanatory notes

Recent research on interference-fit threads has shown that tolerance Sk6 specified for the pitch diameter of external threads does not ensure sufficient tightness of fit. Thus, a new interference-fit thread has been developed in which a tight fit is achieved by an increased external thread major diameter (see H.J. Bestenreiner. *Metrisches ISO-Gewinde; Gewinde für Festsitz in Leichtmetall-Legierungen (DIN 8141-1 und DIN 8141-2)* (ISO metric screw thread; interference-fit threads in light metal alloys) (DIN 8141-1 and DIN 8141-2)).

For use in light metals, it is recommended that studs as specified in DIN 949-1 or DIN 949-2 be used which are provided with a DIN 8141-1 interference-fit thread. Such studs are particularly suitable for automatic assembly (e.g. in the automobile industry), since both thread ends can be produced to the same thread limits of size without the strength of the stud/nut assembly being weakened.
